Creature species (beast, arcanaform)

Creature size

Creature “weight” (Light (scholarly), Mid (skill), Heavy (combat))

- The weight isn't their role but reflects their durability and combat capabilities. A mage from either of the war colleges (Deepguard or Stormpeak) will be medium and heavy while unity and illusions will likely be light.

Creature capability (novice, journeyman, master)

Purpose/unique features

With these I was considering how many monster Statblocks are typically similar across concepts. A medium mid novice humanoid is basically a “thug” with a palette swap of the unique features.

This came about after considering what the “orcwort” is from 3.5 and how the concept can be adapted to any creature species (like arcanaform) to radically change the flavor without changing any other stats.
